

CO2 emissions per country

The visualisation shows data on CO2 emissions per capita (the average per person) and total CO2 emissions for 20 countries. The selected countries are in the top-20 for emissions per capita in 2019 among the states with a population of over 5 millions people. Data is visualised for each country: CO2 emissions per capita are represented from 2000 to 2019. The countries are ordered along the horizontal axis by population and along the vertical axis by GDP (2019 data).
